Reporting Status of Vulnerability-related Information about Software Products and Websites
- 2nd Quarter of 2009 (April – June) -

Information-Technology Promotion Agency, Japan (IPA) and Japan Computer Emergency Response Team Coordination Center (JPCERT/CC), initiated to handle vulnerability-related information in July, 2004, pursuant to the Standards for Handling Software Vulnerability Information and Others (Directive #235, 2004) by the Ministry of Economy, Trade and Industry (METI).

With the authority given by the Directive, IPA has been accepting reports on the following vulnerability-related information:

1: Vulnerability-related Information about Software Products:
Vulnerabilities against client software such as OS and browser, server software such as Web server, software embedded in hardware such as IC card, and so on. Other than vulnerability itself, information on verification methods, attacking methods and workarounds are also accepted. IPA will notify these vulnerability-related information to JPCERT/CC and it will communicate those information to concerned organizations such as domestic vendors.

2: Vulnerability-related Information about Websites (Web Applications):
Vulnerabilities against web systems which provide services to the public through the Internet. IPA will notify such vulnerability-related information to Web site managers to prompt modification.

Effect Expected:
1. Encourage vendors and Web site managers to implement countermeasures against vulnerabilities.
2. Prevent vulnerabilities from being carelessly publicized or left unsolved.
3. Prevent important information, such as personal information, from being disclosed and/or critical systems from being shut down.

"Information Security Early Warning Partnership"
(Framework for Handling Vulnerability-related Information)

Source: Handouts from explanatory session on handling vulnerability-related information (General introduction to the standards for handling software vulnerability-related information and its guidelines) by the Ministry of Economy, Trade and Industry
The statistics for the 2nd Quarter of 2009 (April – June) derived from the data collected based on the framework is summarized as follows.

1. **Reported Number and Handling Status of Reports:**

The total number of vulnerability-related information reported to IPA from April 1 to June 30, 2009 was 429: of 43 were on software products and the rest of 386 were on Website. The cumulative number of reports made to IPA since the framework started (July 8, 2004) was 5660: of 955 were on software products and the rest of 4705 were on Website. The Chart 1-1 shows the reporting status for respective quarters.

### Chart 1-1: Quarterly Number of Vulnerability-related Information

The Chart 1-2 shows the processing status of reports on the vulnerability-related information as of the end of June, 2009. As for software products, 45% (367) of the reports being accepted as vulnerability (812) are modified and publicized. As for Website, 43% (1988) of the reports being accepted as vulnerability (4596) are fixed.

**Legend:**
- **Reported Number/Business Day:**
  - 1Q/2006: 1.61
  - 1Q/2007: 1.95
  - 1Q/2008: 2.24
  - 1Q/2009: 4.55
  - 2Q/2008: 2.38
  - 2Q/2009: 4.66
  - 3Q/2008: 2.79
  - 3Q/2009: 4.00
  - 4Q/2008: 4.00

- **Publicized:** Vulnerability which has been publicized with vendor’s responding status on JVN
- **Vendor-Handled:** Vulnerability which has been informed to each user by vendor individually
- **Not Accepted:** Vulnerability which has been determined not to be vulnerability by vendor
- **Handling:** Vulnerability which is being studied/handled by vendor
- **Non Vulnerability:** Vulnerability which has been determined not to be vulnerability by Website manager
- **Fixed:** Vulnerability fixed by Website manager
- **Unable to Contact:** It is not possible to contact the Website manager
- **Total:**
  - Software Products: 955
  - Website: 4705

### Chart 1-2: Processing Status of Reporting for Vulnerability-related Information

(As of the end of June, 2009)
2. Handling of Vulnerability-related Information on Software Products and its Coordination:

The total number of information related to vulnerabilities in Software Products reported to IPA since the framework started in July 8, 2004, was 955. The Chart 2-1 shows the breakdown for 367 of publicized vulnerabilities, and the Chart 2-2 shows the breakdown for 812 reports related to the vulnerabilities in software products.

The vulnerabilities are organized according to severity, determined by the Common Vulnerability Scoring System (CVSS v2) standard. The scale of low, medium, and high severity corresponds to the following scores:

- **Low**: Vulnerabilities will be labeled the Low severity if they have a CVSS base score of 0.0 - 3.9.
- **Medium**: Vulnerabilities will be labeled the Medium severity if they have a CVSS base score of 4.0 - 6.9.
- **High**: Vulnerabilities will be labeled the High severity if they have a CVSS base score of 7.0 - 10.0.

The most reported was Web application and Web Browser subsequently followed.

The Chart 2-3 shows the time required for the announcement of vulnerabilities in software products. 32% of reports was addressed within 45 days from its initial reporting and announcement.

In this Quarter, 30 vulnerabilities were being publicized.
3. Handling of Vulnerability-related Information for Website:

The total number of information related to vulnerabilities in Websites reported to IPA since the framework started in July 8, 2004, was 4705: excluding those being determined not to be vulnerability, the breakdowns for 4596 information reported are shown in the Chart 3-1 and 3-2.

- Breakdown of 4596: Numbers in the parenthesis are for the previous Quarter

**Chart 3-1: Breakdown of Vulnerabilities in Websites by Type**
(from July 8 2004, to the end of June, 2009)

As for the type of vulnerabilities, “Cross-site scripting”, “Lamed DNS zone” and “SQL injection” account for 86% of the entire vulnerabilities.

**Chart 3-2: Shift in Number of Vulnerabilities in Websites by Type**
(from July 8 2004, to the End of June, 2009)
The Chart 3-3 and 3-4 show the time required to modify vulnerabilities by type after notification of detailed information of the vulnerabilities to Website managers. 79% of vulnerabilities reported was fixed within 90 days.
