Reporting Status of Vulnerability-related Information about Software Products and Websites
- 1st Quarter of 2015 (January – March) -

Information-technology Promotion Agency, Japan (IPA) and Japan Computer Emergency Response Team Coordination Center (JPCERT/CC), initiated to handle vulnerability-related information in July, 2004, pursuant to the Standards for Handling Software Vulnerability Information and Others (Directive #110, 2014) by the Ministry of Economy, Trade and Industry (METI).

With the authority given by the Directive, IPA has been collecting reports on the following vulnerability-related information:

1: Vulnerability-related Information about Software Products:
Vulnerabilities against client Software such as OS and browser, server Software such as Web server, Software embedded in hardware such as IC card, and so on. Other than vulnerability itself, information on verification methods, attacking methods and workarounds are also accepted. IPA will notify these vulnerability-related information to JPCERT/CC and then JPCERT/CC will communicate those information to concerned organizations such as domestic product vendors.

2: Vulnerability-related Information about Websites (Web Applications):
Vulnerabilities against Websites which provide services to the public through the Internet. IPA will notify such vulnerability-related information to Website managers to prompt modification.

Effect Expected:
1. Encourage vendors and Website managers to implement countermeasures against vulnerabilities.
2. Prevent vulnerabilities from being carelessly publicized or left unsolved.
3. Prevent important information, such as personal information, from being disclosed and/or critical systems from being shut down.

“Information Security Early Warning Partnership”
/Framework for Handling Vulnerability-related Information/

Source: Handouts from explanatory session on handling vulnerability-related information (General introduction to the standards for handling Software vulnerability-related information and its guidelines) by the Ministry of Economy, Trade and Industry
The statistics for the 1st Quarter of 2015 (January – March) from the data collected under the framework is summarized as follows.

1. Reported Number and Handling Status of Reports:

The total number of vulnerability-related information reported to IPA from January 1 to March 31, 2015 was 245: 84 of them were about Software products and the rest of 161 were about Websites. The cumulative number of reports made to IPA since the framework started (July 8, 2004) was 10898: 2034 of them were about Software products and the rest of 8864 were about Websites. The Chart 1-1 shows the reporting status for respective quarters.

[Chart 1-1: Quarterly Number of Vulnerability-related Information]

The Chart 1-2 shows the processing status of reports on the vulnerability-related information as of the end of March, 2015. As for Software products, 57% (1000) of the reports being accepted as vulnerability (1755) have been fixed and publicized. As for Websites, 76% (6194) of the reports being accepted as vulnerability (8674) have been fixed.

![Chart 1-2: Processing Status of Reporting for Vulnerability-related Information (As of the end of March, 2015)]
2. Handling of Vulnerability-related Information on Software Products and its Coordination:

The total number of information related to vulnerabilities in Software Products reported to IPA since the framework started in July 8, 2004, was 2034. The Chart 2-1 shows the breakdown of 1000 of publicized vulnerabilities, and the Chart 2-2 shows the breakdown of 1755 reports related to the vulnerabilities in Software products.

The vulnerabilities are organized according to their severity, determined by the Common Vulnerability Scoring System (CVSS v2) standard. The scale of low, medium, and high severity corresponds to the following scores:

- **Low**: Vulnerabilities will be labeled the Low severity if they have a CVSS base score of 0.0 - 3.9.
- **Medium**: Vulnerabilities will be labeled the Medium severity if they have a CVSS base score of 4.0 - 6.9.
- **High**: Vulnerabilities will be labeled the High severity if they have a CVSS base score of 7.0 - 10.0.

The most reported type of software was Web application and subsequently followed by Web Browser and those listed below.

The Chart 2-3 shows the time required for the announcement of vulnerabilities in Software products. 32% of the reports was addressed within 45 days from its initial reporting to announcement.

**Chart 2-1: Severity of Vulnerabilities in Software Products**
(from Initial Acceptance to the end of March, 2015)

**Chart 2-2: Breakdown of the Vulnerabilities in Software Products**
(from July 8, 2004 to the end of March, 2015)

Misc. in this graph includes Software for Database, etc.

(Breakdown of 1755: Numbers in parenthesis are for the previous quarter)

**Chart 2-3: Time Required for the Announcement of Vulnerabilities in Software Products**

In this Quarter, 41 vulnerabilities were announced.
3. Handling of Vulnerability-related Information on Websites:
The number of information related to vulnerabilities in websites reported to IPA since the
framework started in July 8, 2004, was 8864. Removing those not accepted as vulnerabilities,
the total number of the vulnerabilities was 8674. Chart 3-1 shows the breakdown of the
vulnerabilities found in last two years and Chart 3-2 shows the quarterly shift in their
proportion.

- Breakdown of 8674: Numbers in the parenthesis are for the previous quarter

**Chart 3-1: Breakdown of Vulnerabilities in Websites by Type**
(from July 8 2004, to the end of March, 2015)

As for the type of vulnerabilities, “Cross-site Scripting”, “Lamed DNS zone” and “SQL
Injection” account for 83% of the entire vulnerabilities.

**Chart 3-2: Shift in Number of Vulnerabilities in Websites by Type**
(from April 1 2013, to the End of March, 2015)
The Chart 3-3 and 3-4 show the time required to fix vulnerabilities by type after notification of detailed information of the vulnerabilities to Website managers. 68% of vulnerabilities reported was fixed within 90 days.

Chart 3-4: Time Required to Fix Vulnerabilities in Websites by Type
